

Local AI Desktop Research Brief

Local-first AI assistants process user documents, prompts, and memories on the user machine wherever possible.

The strongest desktop assistant designs combine local inference, visible privacy proof, permission-based automation, and reversible actions.

Important evaluation dimensions include reliability, artifact generation, memory control, desktop context awareness, and clear user trust.

Luna demonstrates these ideas with an orb, command router, artifact studio, knowledge vault, safe file automation, skill creator, and trust center.
